

MEGABYTE

CSI SIESGST

2026 EDITION

EMPOWERING MINDS, SHAPING THE DIGITAL FUTURE

EDITOR'S NOTE

Welcome to the sixth edition of MEGABYTE, the official technical magazine of the CSI Student Chapter of SIES Graduate School of Technology. We stepped into this challenging arena with the motive of learning something new.

Putting together a magazine is no cake walk and the finished product you are holding is the culmination of the efforts of the entire Magazine Team.

MEGABYTE basically denotes the purpose of the magazine that is to chronicle different technological developments around the world, along with extraordinary achievement of the students of SIES GST. MEGABYTE essentially denotes the magazine's aim, which is to document various technical developments made around the world as well as noteworthy academic accomplishments made by the students of SIES GST.

This issue brings to you diverse articles such as advancements in Blockchain, Artificial Intelligence, Metaverse, Quantum Computing, etc. Also, we have unique interviews with our own alumni who are employed in both technical and non-technical industries.

The authors of the pieces in this magazine have made essential contributions. In the future years, keep an eye on this publication. Everything we do derives from its long-standing character, approach and quality, and we will continue to produce future editions with the same passion as before.

WHAT IS CSI ?

From a handful of IT enthusiasts to the largest body representing computer professionals in India, the Computer Society of India has come a long way since its foundation in 1965. The founding members felt the need to organize their activities and also wanted to share their knowledge and exchange ideas about the computer sector which was then newly emerging.

Today the CSI takes pride in being the largest and most professionally managed association for IT professionals in India. It has 72 chapters across India, 511 student branches, and 100,000 members. The Society also encourages and assists professionals to maintain integrity and competence in the profession and fosters a sense of partnership amongst members.

MESSAGE FROM PRINCIPAL

DR. K LAKSHMISUDHA

Dear Readers,

I am thrilled to present the **2026 Edition of MEGABYTE**, Annual magazine of CSI SIESGST.

Education is an endless journey of discovery and growth. As educators, we go beyond imparting knowledge; we nurture continuous personal and professional development among our students. We encourage them to face challenges, learn from setbacks, and strive for excellence and effective leadership.

Guiding our students with values such as resilience, integrity, and discipline is crucial for their self-realization.

I extend my heartfelt congratulations to the entire team for their unwavering dedication in inspiring others through MEGABYTE. Let's celebrate the achievements of CSI and the profound impact of MEGABYTE as our students embark on their journey to leave their mark on the world.

MESSAGE FROM HOD'S DESK

Dear Readers,

I'm delighted to introduce the much-anticipated **2026 Edition of MEGABYTE, the annual magazine of CSI SIESGST.**

This publication symbolizes the dedication and innovation of our team and the transformative impact of CSI within our community. Together, we've established a platform that not only highlights technological advancements but also inspires individuals to push boundaries and create meaningful change.

Congratulations to the entire team for their unwavering commitment to excellence in crafting MEGABYTE. Your efforts have been instrumental in shaping the future of technology and fostering a culture of innovation within our institution.

As we reflect on the achievements of CSI and the profound influence of MEGABYTE, let's continue to strive for greatness and make a lasting impact in the ever-evolving world of technology.

*Dr. Aparna Bannore
HOD of Computer Engineering
SIES Graduate School of Technology*

MESSAGE FROM SBC CSI SIESGST

Dear Readers,

We are glad to introduce the **2026 Edition of the annual magazine of CSI SIESGST, MEGABYTE.**

MEGABYTE is all about technology that inspires students to do something, that leaves an everlasting mark in the world of technology. Thus, it is our job to ensure inspiring technological developments are being brought to the students of SIESGST, by the students, faculty members and alumni of CSI-SIES GST itself.

Everything right from the collection of articles up to the final edits were quite smooth. I worked closely with the team to ensure that everything was done according to the deadlines. The work was performed in a very professional manner. Thanks to the team of MEGABYTE for their commendable job.

I would also like to thank each and every member of MEGABYTE without whose support this would not have been possible. I hope that you all enjoy reading this magazine.

Dr. Namrata Patil
Student Branch Incharge
CSI SIESGST

MESSAGE FROM CHAIRPERSON

Dear Readers,

It gives me immense pleasure to welcome you to the 6th edition of our Annual Magazine, **“MEGABYTE.”** This magazine is a reflection of the passion, innovation, and collective efforts of the CSI SIES GST student chapter in nurturing technical excellence and creating meaningful learning opportunities for students.

Being a student of Electronics and Telecommunication Engineering, my journey with CSI was not a conventional one. Entering a computer-focused organization from a core electronics background came with several doubts and challenges. Joining CSI initially felt unusual, and adapting to this new domain required constant effort and self-belief. However, my keen interest in computers and emerging technologies motivated me to step out of my comfort zone and explore new possibilities.

Driven by this curiosity, I joined CSI in my third year and took on the role of Secretary. This phase proved to be a turning point in my journey. During my tenure, I had the opportunity to conduct and manage multiple workshops and technical events, which helped me develop strong leadership, coordination, and management skills while contributing actively to the growth of the chapter.

As the Chairperson of CSI SIES GST, my vision has been to increase the number of workshops and ensure that they are industry-relevant and placement-oriented, helping students bridge the gap between academics and real-world requirements. With a keen interest in Artificial Intelligence and Cybersecurity, I have aimed to promote workshops and initiatives that introduce students to these rapidly evolving domains and prepare them for future career opportunities.

I would like to express my heartfelt gratitude to our Student Branch Counselor, Dr. Namrata Patel ma'am, whose constant guidance and encouragement played a crucial role in my journey. She helped me believe that being from EXTC does not limit one's potential, and that with dedication and passion, I could confidently take up the responsibility of being the Chairperson of CSI. Her support has been truly invaluable.

Leading the CSI chapter comes with immense responsibility, and managing multiple teams has taught me the importance of teamwork, perseverance, and effective communication. This edition of MEGABYTE showcases our flagship events and initiatives, made possible through the unwavering support of our Principal, HOD, faculty in-charge, and faculty members, to whom I extend my sincere thanks.

I invite you to explore the pages of this magazine and witness the dedication and creativity of our CSI family. I hope this edition inspires you to pursue your interests fearlessly, embrace learning beyond boundaries, and grow together in the world of technology.

Warm regards,

Gouri Huilgol

Chairperson - CSI SIES GST

HYBRID AI MODELS FOR PHISHING & SOCIAL ENGINEERING PREVENTION

Hybrid AI models are emerging as one of the most effective defenses against phishing and social engineering attacks, combining machine learning's adaptability with rule-based precision to detect evolving threats in real time. These systems enhance accuracy, adapt quickly to new attack patterns, and provide human-centric insights to counter manipulation tactics.

Phishing and social engineering attacks remain among the most dangerous cybersecurity threats worldwide. They exploit human psychology and technical vulnerabilities to steal sensitive data. Traditional defenses like blacklists or static rules struggle against modern, AI-generated phishing attempts. Hybrid AI models offer a stronger solution by blending machine learning (ML) and rule-based systems.

What Are Hybrid AI Models?

Hybrid AI models integrate adaptive learning with predefined rules, creating a layered defense system.

Machine Learning (ML): Detects anomalies, suspicious patterns, and evolving phishing techniques using NLP and deep learning.

Rule-Based Systems: Apply expert-crafted rules to catch known phishing signatures and social engineering tactics. This dual approach ensures both flexibility and consistency in detection.

Benefits of Hybrid AI for Phishing Prevention

Hybrid AI models offer a powerful defense against phishing and social engineering by combining behavioral analysis with rule-based logic for enhanced detection accuracy. They adapt in real time to emerging threats, analyze user interactions to uncover manipulation tactics, and reduce false positives by balancing automated learning with expert-crafted rules. Scalable across enterprise networks, these models provide efficient protection for organizations of all sizes.

Risks & Challenges

Hybrid AI models face several challenges despite their effectiveness. Adversarial AI poses a growing threat as attackers use generative tools to craft highly convincing phishing content. The reliance on large datasets for machine learning introduces data privacy concerns if not managed securely. Implementing hybrid systems also demands substantial investment in infrastructure and expertise. Moreover, the human factor remains critical no matter how advanced the AI, user awareness and training are essential to counter social engineering tactics effectively.

These models represent the future of phishing and social engineering prevention. By combining adaptive ML algorithms with rule-based safeguards, organizations can build a robust, proactive defense against evolving cyber threats. While challenges exist, the benefits especially in accuracy and adaptability make hybrid AI a cornerstone of modern cybersecurity strategies.

- Dr. Suvarna Chaure

FROM CHATBOTS TO AGENTIC INTELLIGENCE

The Evolution of Autonomous Systems:

Artificial Intelligence (AI) has evolved significantly from simple rule-based chatbots to more sophisticated autonomous agents that can handle complex, multi-step tasks. Unlike traditional AI systems that respond to queries, Agentic AI can plan, execute, and adapt autonomously, making it ideal for enterprise workflows that require continuous decision-making and execution.

Agentic AI refers to systems that can interpret goals, break them down into actionable tasks, and execute them autonomously. Unlike chatbots, which provide single responses, agentic systems engage in multi-step workflows, interacting with tools, databases, and external systems to complete tasks without human intervention. These agents are designed to handle workflows that require adaptability, context-awareness, and coordination.

For example, in a procurement system, agentic AI can automatically gather information, check policy compliance, and seek approval without manual input, ensuring efficiency and reducing errors.

The Governed Agency Stack is a layered architecture that enables autonomous execution while ensuring compliance, safety, and adaptability.

- **Goal Layer:** Defines clear objectives and success criteria.
- **Context Layer:** Provides necessary background (e.g., data, rules, history).
- **Planning Layer:** Breaks down goals into actionable subgoals and plans the execution.
- **Action Layer:** Executes tasks by invoking tools or external systems.
- **Governance Layer:** Ensures compliance with policies, security, and ethical standards.
- **Learning Layer:** Continuously adapts and improves the system's actions based on feedback.

Key Advantages of Autonomous Agents

- **Efficiency:** Automates repetitive and complex tasks, reducing human error and enhancing productivity.
- **Scalability:** Can handle increasing workloads without proportional increases in cost.
- **Continuous Learning:** Improves over time by learning from past interactions, making the system more reliable.
- **Governance:** Ensures actions align with regulatory standards, crucial for sectors like finance and healthcare.

Challenges and Considerations

While promising, agentic AI faces challenges:

- **Trust and Transparency:** Ensuring the AI's decisions are understandable and explainable.
- **Data Quality:** Autonomous agents require accurate and well-integrated data to function effectively.
- **Human Oversight:** Human-in-the-loop remains important for critical decisions and high-stakes scenarios.

The Future of Work

Agentic AI is transforming business operations by automating entire workflows. From customer service to supply chain management, these autonomous agents are poised to become digital workers, capable of managing complex tasks end-to-end. As organizations adopt this technology, the focus will shift to integrating these systems seamlessly into business processes while maintaining strong governance to ensure compliance and ethical standards.

In conclusion, Agentic AI represents the future of enterprise automation. It is no longer about simply answering questions, but about AI autonomously executing tasks, improving efficiency, and driving business outcomes.

Dr. Ujwala Ravale

SYNTHETIC DATA

The Hidden Backbone of Modern AI

Artificial Intelligence is evolving rapidly from recommendation systems to autonomous vehicles, every intelligent model relies on one crucial resource data. However, collecting real-world data today is expensive, time-consuming, and heavily restricted by privacy regulations. Organizations face challenges such as limited datasets, legal constraints, and ethical concerns. That's where synthetic data steps in. **Synthetic data** is artificially generated data that statistically mirrors real-world data without containing actual personal or sensitive information. It enables AI systems to be trained efficiently while maintaining privacy and compliance.

But the real question is: Is synthetic data the future of AI training, or just a support tool?

A healthcare organization building an AI model for disease detection needs large volumes of patient data. However, privacy laws, data bias, and slow data collection create major challenges.

Synthetic data solves this by generating realistic patient data that mimics statistical patterns without exposing real identities.

Result:

- Faster and efficient model training
- Strong patient privacy protection
- Continued innovation without legal constraints

This demonstrates the strategic value of synthetic data.

How Is Synthetic Data Generated?

1. **Generative Adversarial Networks (GANs)** Two neural networks compete one generates artificial data, the other evaluates it. Over time, the data becomes highly realistic.
2. **Data Augmentation** Existing data is modified (rotated images, added noise, text variations) to expand datasets and improve model robustness.
3. **Simulation Environments** Virtual environments are used in industries like autonomous driving and robotics to generate large-scale training scenarios.

Advantages

- Privacy Protection
- Scalability and Unlimited Data Supply
- Cost Efficiency
- Bias Management
- Faster Experimentation and Innovation

Limitations

- May miss rare real-world patterns
 - Can amplify bias if poorly generated
 - Models may struggle in unpredictable real environments
- Complement,
Not Replacement Synthetic data should not replace real-world data entirely.

Complement, Not Replacement

Synthetic data should not replace real-world data entirely. The most effective AI systems use a hybrid approach, combining real datasets with synthetic augmentation. Responsible implementation requires validation, continuous testing, and ethical oversight.

Industry Adoption and Real-World Applications

Synthetic data has rapidly transitioned from a theoretical concept to a practical solution widely adopted across multiple industries. In healthcare, it enables the creation of realistic patient datasets that support the training of diagnostic AI models while maintaining strict privacy standards. In finance, organizations use synthetic transaction data to detect fraud and analyze risks without exposing sensitive customer information. Similarly, autonomous vehicle companies rely on simulation environments powered by synthetic data to train self-driving systems across diverse and complex driving scenarios, including rare and hazardous situations.

This growing adoption highlights that synthetic data is not only solving data-related challenges but also accelerating innovation, ensuring compliance, and improving the overall efficiency of AI systems.

By 2030, Synthetic Data Will Completely Overshadow Real Data in AI Models

Conclusion

Synthetic Data is not merely a shortcut it is a strategic innovation shaping the future of AI development.

As privacy regulations tighten and AI systems demand larger datasets, synthetic data will become increasingly essential in building scalable, ethical, and intelligent solutions. The future of Artificial Intelligence may not depend only on how much data we collect but on how intelligently we generate it.

Ashutosh Sonwal
Media Mentor

GENERATIVE AI

Creativity Booster or Skill Killer?

The Rise of Generative AI

Imagine sitting in front of your laptop with a blank screen and a tight deadline. Instead of struggling for ideas, you open an AI tool, type a short prompt, and within seconds you receive a structured article, a working code snippet, or even a creative design concept. This is no longer science fiction. This is the reality of Generative Artificial Intelligence.

Over the past few years, generative AI has rapidly moved from research laboratories into classrooms, offices, startups, and personal devices. The speed, efficiency, and creativity displayed by these tools have sparked both excitement and concern across industries.

Understanding How Generative AI Works

Generative AI is powered by advanced deep learning models such as transformers and generative adversarial networks. These models are trained on massive datasets containing text, images, audio, and code. During training, the model learns patterns, relationships, and structures within the data.

When given a prompt, the system predicts the most probable output based on context and learned patterns. Although the process is mathematical, the results often appear surprisingly human-like and creative.

The Risk of Skill Dependency

Despite its impressive capabilities, generative AI introduces serious concerns. One major issue is the potential decline in critical thinking. When AI provides instant answers, users may skip the mental effort required to analyze problems deeply. Students might rely on AI-generated assignment without fully understanding the concepts. Developers may use generated code without learning the logic behind it. Over time, this dependence can weaken analytical skills and reduce true expertise.

Ethical and Professional Challenges

Generative AI also raises ethical concerns. AI-generated content may contain bias, inaccuracies, or outdated information. Without proper verification, misinformation can spread quickly.

There are also concerns regarding originality and intellectual property. Organizations must establish ethical guidelines to ensure responsible usage of AI tools.

Key Benefits of Generative AI

- Increases productivity by automating repetitive tasks such as drafting emails, writing reports, or generating code.
- Acts as a brainstorming partner that helps overcome creative blocks and explore new perspectives.
- Supports rapid prototyping and reduces development time.
- Democratizes creativity by enabling non-experts to produce professional-level content.
- Provides personalized learning assistance by explaining complex topics step by step.

Conclusion

Generative AI is one of the most transformative technological shifts of our time. It accelerates innovation and enhances productivity, yet overdependence may weaken critical thinking. Ultimately, generative AI is neither purely a creativity booster nor entirely a skill killer. Its impact depends on how responsibly and intelligently it is used.

THE HIDDEN COST OF FREE APPS

How Your Data Becomes the Product?

In today's world the word "free" is really powerful when it comes to getting people to use things like media, games and shopping apps. We can get all these things without paying any money.. Have we ever thought about how these apps make money if they are free?

The answer is pretty simple. It is also kind of scary: we are not the people using these apps we are the thing being sold.

The Business Model Behind Free Apps

Free apps make money by collecting data about what we do. Every time we click on something like something search for something. Tell the app where we are it gets recorded and looked at. This data helps companies understand what we like what we do not like and how we feel. Companies use this information to make ads that're just for us. The more they know about us the more money they can make from these ads. So our data is being sold,. Not in a way that is obvious. It is being sold as information about what we do. What we like.

The Power of Data Profiling

The computers that run these apps can make detailed profiles of us. They can figure out what we might want to buy what we like to look at and what we think about certain things. This can be good because it makes the apps more fun to use.. It is also a little scary because it means the apps know a lot about us. If an app knows what we like and what we do not like it can try to get us to do things without us even realizing it.

The Illusion of Consent

When we get an app we usually just click "yes" to the terms and conditions without reading them. This means we are giving the app permission to collect a lot of data about us. The problem is that we do not really know how data they are collecting or what they are doing with it.

Our phones can track where we are, what we look at on the internet who we talk to and what we say. This is convenient. It also means we are not really in control of our own data.

Is It Worth It?

It is true that these apps can be really smart and helpful. They can suggest things we might like show us ads that're relevant and even help us find things we need.

There is a downside. We are giving up some of our privacy. That can be a problem. There are people who might try to steal our data or use it in ways that're not good for us. This is something we should be worried about.

Free apps are not really free. We are trading our data for the convenience of using them. We need to be more careful about what we share and how it is used. The real question is, are we okay, with giving up our privacy to use these apps?

▮ **Sayali Patil**
Technical Coord

BEYOND THE ALGORITHM

How AI-Powered Insights Are Redefining the Way We Understand Ourselves

Every year, millions of people wait for one moment: the day their favourite platform releases their “Wrapped.” The internet explodes, timelines fill with colourful slides, and suddenly everyone is proudly sharing their top songs, binge habits, or screen-time patterns like badges of honor. It almost feels magical, but beneath the aesthetics, something deeply human is happening.

We don’t just love music or movies. We love seeing ourselves reflected through our own data, and that’s where AI steps in: quietly collecting, analyzing, interpreting, and turning our daily digital footprints into motivation. Before the technology, there was a simple truth: **People feel motivated when they understand themselves.**

Seeing your year visualized in terms of your habits, moods, peaks, dips, and favourites gives you:

- clarity, because your data reveals patterns you didn’t notice
- validation, because it shows that your choices shaped something
- momentum, because progress becomes visible
- identity, because your habits tell a story about who you are

It’s not about perfection. It’s about pattern recognition

But how exactly does AI recognize these patterns and transform them into meaningful insights? Wrapped-style experiences tap into the “Quantified Self” movement: using numbers and insights to foster self-awareness. Tracking creates accountability, data creates clarity, and clarity creates motivation.

Under the hood, these experiences analyze your behaviour, your sentiment, and your patterns all at once what you do, how you feel, and when or why you return to certain habits.

Techniques like cluster analysis, recommendation models, and behaviour analytics work together to transform raw clicks, routines, and choices into a personalized highlight reel of your year. It's not random; it's AI actively building a narrative around your decisions and rhythms.

Human-centered visual design comes in Motivational dashboards which use:

- social norms (“You listened more than 85% of users in your city”)
- future simulations (predicted progress if you continue a habit)
- visual metaphors (streaks, badges, avatars, celebrations)
- humour and personality (quirky messages, vibrant slides)

These emotional cues turn cold data into something you can connect with.

A “sick bear” avatar for high screen time works better than a plain warning.

A confetti burst when you study 7 days in a row feels like a reward.

A progress sunburst in a fitness app makes effort feel visible.

Visualization is the bridge between data and motivation.

As AI becomes more advanced, our data stories will become more personal, more emotional, and more meaningful. The future of AI isn't just automation; it's self-awareness. AI isn't just analyzing us, it's holding up a mirror that reveals patterns we couldn't see alone. Of course, not everyone wants their life quantified and valid concerns around data privacy and consent remind us that these systems are only as trustworthy as the companies behind them.

But for those who do engage, the insight AI offers is becoming harder to ignore. When your data is turned into a story, you stop guessing your progress and start understanding it.

Sanjana Gadapa
Design Head

LURKING THREATS

Understanding Web Application Vulnerabilities

Every day, billions of users interact with web applications for banking, shopping, education, and social media. Behind these seemingly simple login pages and search bars lies a complex ecosystem of code, databases, and real-time data exchange.

Today, web applications are among the most targeted components of the digital landscape. Many cyber breaches do not occur because attackers are extraordinarily sophisticated, but because applications often contain common vulnerabilities that developers overlook.

Understanding these weaknesses is the first step toward building safer and more resilient digital systems.

Why Web Vulnerabilities Matter?

Web applications manage highly sensitive information, including:

- Personal identities
- Passwords and authentication credentials
- Financial data

A single flaw in design or implementation can allow attackers to steal data, manipulate systems, or even

take complete control of an application. In large-scale systems, such vulnerabilities can impact thousands sometimes millions of users.

Cybersecurity awareness is no longer optional. In an interconnected world, it is essential.

1. SQL Injection (SQLi)

SQL Injection is one of the oldest yet still one of the most dangerous — web vulnerabilities. It occurs when an application fails to properly validate or sanitize user input before including it in database queries.

For instance, rather than entering a legitimate username, an attacker may inject specially crafted SQL commands that manipulate the database into revealing sensitive information.

Attackers can exploit this flaw to:

- Access confidential database records
- Bypass authentication mechanisms
- Delete or modify stored data

2. Cross-Site Scripting (XSS)

XSS allows attackers to inject malicious scripts into trusted websites. When users visit the page, the script runs in their browser.

It can be used to:

- Steal cookies and session tokens
- Hijack user accounts
- Display malicious content

The danger exists because users trust the website. Input sanitization and output encoding help prevent XSS.

3. Broken Authentication

Authentication protects user accounts, but weak login systems create vulnerabilities.

Broken authentication may include:

- Weak or predictable passwords
- Poor session management
- Credential stuffing attacks
- No multi-factor authentication

These weaknesses allow attackers to gain unauthorized access. Strong passwords, secure sessions, and multi-factor authentication reduce this risk.

4. Cross-Site Request Forgery (CSRF)

CSRF tricks a logged-in user into performing actions without their knowledge.

Examples include:

- Changing account information
- Making unauthorized transactions
- Submitting hidden forms

Since the request comes from an authenticated user, it appears legitimate. Anti-CSRF tokens and secure sessions help prevent this attack.

5. Security Misconfigurations

Sometimes vulnerabilities occur due to improper system setup rather than coding errors. Examples include:

- Default admin credentials
- Exposed server information
- Unpatched software
- Misconfigured cloud storage

Regular updates, audits, and configuration checks help reduce these risks.

Technical Coord

EVENT TIMELINE

A national-level technical project competition providing a platform for students to present innovative ideas and technological solutions.

INNOVATIONS 2025

DSA WORKSHOP

A comprehensive two-day DSA workshop focusing on C++, algorithms, and data structures fundamentals

Covered the basics of Web Application Penetration Testing to introduce students to ethical hacking, web security, and common vulnerabilities.

CYBERSECURITY WORKSHOP

AI ANALYTICS & DECISION MAKING

Centered on leveraging analytical techniques and AI-driven insights to enable precise, strategic, and informed decision-making.

A dynamic national hackathon that brought together innovative minds to solve real-world problems through technology, creativity, and collaboration.

ENIGMA 4.0 CHRONIX

SYNAPSE FIRST EDITION

An AI Job Stimulation Competition encouraged students to analyze real-world failure cases and propose AI-based solutions.

DSA AND PROBLEM-SOLVING WORKSHOP

The CSI, Student Branch of SIES GST, conducted a two-day **DSA and Problem-Solving Workshop** on **31st July and 1st August 2025** for SE, TE, and BE students across various branches.

The workshop focused on strengthening core concepts in Data Structures and Algorithms through practical, hands-on learning. Students engaged in coding exercises, algorithmic challenges, and interactive discussions to enhance their logical thinking and problem-solving skills.

- Covered topics: C++ fundamentals, time complexity, recursion, bitwise operators, and lambda functions
- Introduction to data structures: arrays, strings, linked lists, stacks, queues, and STL
- Hands-on coding sessions and interview-level problem-solving
- Interactive Q&A and doubt-solving sessions

The workshop received positive feedback and successfully improved students' coding confidence and analytical abilities, reflecting CSI SIESGST's dedication to technical skill development.

CYBERSECURITY WORKSHOP

The CSI, Student Branch of SIES GST, organized a Cybersecurity Workshop titled “Basics of Web Application Pentesting” on 6th August 2025 for SE, TE, and BE students across different branches. The workshop aimed to introduce students to the fundamentals of web application security, ethical hacking, and penetration testing through practical learning sessions.

The session focused on increasing awareness about cybersecurity threats and vulnerabilities in modern web applications. Through live demonstrations and hands-on activities, participants learned how security professionals identify and analyze vulnerabilities in web systems. The workshop created an interactive learning environment that encouraged students to actively participate and explore real-world cybersecurity practices. During the workshop, students were introduced to the basics of web application security and ethical hacking, along with the importance of penetration testing. Participants also learned about the penetration testing methodology, including reconnaissance, scanning, exploitation, and reporting.

The session also covered common threats from the OWASP Top 10 vulnerabilities, such as Cross-Site Scripting (XSS), SQL Injection (SQLi), Cross-Site Request Forgery (CSRF), and authentication flaws. Students were also given exposure to industry-standard cybersecurity tools like Burp Suite, OWASP ZAP, sqlmap, Postman, and browser developer tools, helping them understand how vulnerabilities are detected in a controlled environment.

A Capture-The-Flag (CTF) challenge was conducted to allow students to apply their learning in a practical scenario. Overall, the workshop enhanced students' understanding of web application security, ethical hacking practices, and vulnerability assessment, while encouraging analytical thinking and problem-solving skills and promoting cybersecurity awareness among students.

SEMINAR ON ANALYTICS, AI AND DATA-DRIVEN DECISION MAKING

The Computer Society of India, SIES Graduate School of Technology organized a seminar titled “Analytics, Artificial Intelligence & Decision Making” on 22nd September 2025 for SE, TE, and BE students across all branches. The session was conducted by Dr. Kumaravel S, a PhD holder from IIM Trichy with industry experience at Ford Motor Company and a certified Six Sigma Green Belt.

The seminar focused on how analytics and artificial intelligence are transforming decisionmaking processes in modern industries. Through real-world examples and case studies from sectors such as healthcare, finance, manufacturing, and automotive, students gained insights into the practical applications of AI and data-driven strategies. The speaker also emphasized the importance of analytical thinking, adaptability, and technical skills for building careers in emerging technology fields.

Key topics discussed included the fundamentals of analytics and AI in decision making, industrial applications of AI, current research trends, and career opportunities in analytics and data science. These discussions helped students understand the growing demand for professionals skilled in data analysis, machine learning, and strategic decision-making

The session concluded with an interactive Q&A discussion, where students clarified their doubts about industry trends and career paths. Overall, the seminar enhanced students’ understanding of AI and analytics in decision-making and encouraged them to explore further opportunities in data-driven technologies and analytics careers.

ENIGMA 4.0 - CHRONIX: A NATIONAL LEVEL WEB DEVELOPMENT HACKATHON

ENIGMA 4.0 – CHRONIX, a national-level web development hackathon was organized by CSI SIESGST on 20th September 2025. With tracks like FinTech and HealthTech the event aimed to promote innovation, creativity, and problem-solving among students interested in web development and emerging technologies.

Around 42 teams were shortlisted for the final round out of 723 participating teams, with pan-India entries from states such as Gujarat and Rajasthan, making the event truly national in scope.

ENIGMA 4.0 was based on the theme “Infinite Realities,” inspired by the concept of the multiverse, encouraging participants to think beyond conventional ideas and develop innovative web-based solutions. The hackathon brought together talented students who collaborated to transform creative ideas into impactful digital solutions.

The competition was conducted in two rounds: an initial online project proposal submission, followed by an on-campus hackathon where shortlisted teams developed functional prototypes within a limited timeframe. Projects were evaluated based on innovation, technical implementation, user experience, and real-world impact.

Participants built solutions across digital inclusivity, social impact, and interactive web applications. Industry professionals and alumni mentored and evaluated teams, with winners receiving cash prizes, certificates, and goodies, while all participants were awarded certificates of participation.

SYNAPSE - AI CASE STUDY COMPETITION

Synapse, the first edition of the AI Case Study Competition was conducted by CSI SIESGST on 13th February 2026. The event aimed to encourage students to apply Artificial Intelligence concepts to real-world problems while promoting analytical thinking and innovation.

Around 65 students from SE, TE, and BE, across different branches and colleges participated in teams. A job simulation case study challenge where participants take on the role of an AI system investigator and Product Strategist to resolve a real-world production failure where participants analyzed AI- failure case files with the issues, and then identified challenges, and proposed innovative AI-driven solutions to address real-world problems. The competition focused on practical application, encouraging students to develop structured problem statements and strategic solutions.

The event included ideation, solution design, and a final presentation round, where teams presented their strategies and frameworks. This helped participants improve their analytical thinking, teamwork, and presentation skills while gaining insights into real-world AI applications.

Overall, Synapse 1.0 provided a platform for students to explore AI-driven problem solving, encouraging creativity, collaboration, and innovation while strengthening their understanding of practical AI applications.

ACKNOWLEDGMENT

We extend our heartfelt gratitude to our management for their unwavering support throughout the journey of CSI SIESGST 2026.

Additionally, we express our appreciation to our Principal, Dr. Lakshmisudha, for her continual encouragement and guidance, which have been instrumental in our endeavors.

Special thanks to our Head of Department, Dr. Aparna Bannore, and Student Branch Coordinator, Dr. Namrata Patel, whose support and motivation have been pivotal in shaping MEGABYTE 2026 into a resounding success.

Lastly, we extend our gratitude to all faculty members, students, alumni, and stakeholders whose valuable inputs and contributions have played a significant role in shaping the final outcome of the magazine.
